## How to use the line painting machine.

### Preparing the paint:

1. **SHAKE THE PAINTJUG WELL.** It should sound like water.  
If it is too thick, it will clog and become an issue.
2. When the paint is ready, move the steel intake (With the lid) from the water jug to the paint jug, the lids can switch places.
3. Make sure to tighten the lids & refill the water jug if it's low.

### Getting started:

4. The switch on the back of the machine should be set to **SPRAY**.
5. **Start the machine** and wait for the paint to start moving through the tubes, replacing the water in the tubes. *It takes about 30 sec.*
6. The paint will start spraying out of the front nozzle instead of the water.

### When you are done:

7. When you are painting the last line, **turn off the machine** and switch the steel intake back over to the water jug.
8. **Turn the machine back on** and paint the last line with the last bit of the paint in the tube until it is fully replaced by water.
9. When water comes out of the nozzle, then you can **turn off the machine**
10. Put the machine back in its spot and plug in the charging cable.

### (Important!) When painting the lines:

- The foul lines **MUST** be on the inside of the field.
- When the boxes are drawn in the sand, the paint **MUST** be placed on the inside of those drawn lines.
- **The paint is PART of the fair territory, so the outside of the painted line is considered outside of the field and boxes.**
